

Simple Receiving for Mailit 7

Welcome to Simple Receiving for Mailit 7!

The Simple Receiving solution set with the FileMaker plug-in Mailit 7 enables you to receive emails for one account only.

These simple solutions consist of three six files.

- The first example retrieves messages using POP3 protocol.
- The second file uses IMAP protocol to retrieve INBOX folder content only, which is identical to POP3 mailbox content.
- The third file uses IMAP protocol to download all available folders content from the IMAP server.
- The fourth file retrieves messages using POP3 protocol in multi-threaded mode.
- The fifth file uses IMAP protocol to retrieve INBOX folder content only, also using multi-threaded mode.
- The third file uses IMAP protocol to download all available folders content from the IMAP server in multi-threaded mode.

As the name suggests the scripting of these files is kept to a minimum in order to make it easier to understand the functions of Mailit 7. All scripts are accessible for viewing. They can also be imported into your own solution.

In conjunction with the Mailit 7 manual this is a good starting point to implement Mailit 7 functions into your own FileMaker solution.
