

Layout Sending for Mailit 7

Welcome to Layout Sending for Mailit 7!

The Layout Sending solution set with the plug-in Mailit 7 enables you to send FileMaker layouts as email messages. A layout will be embedded into a message as an inline image.

These simple solutions consist of three example files. The first example sends a sample invoice (FileMaker list layout with records) limited to one page one. This sample uses the most simple scripting.

The second file sends a multi-page FileMaker layout, with no limit to the pages amount.

The third file uses a PDF format, generated using FileMaker native facilities, as a layout image.

The scripting of these solutions is kept to a minimum in order to make it easier to understand the functions of Mailit 7. Using these files you will be able to send one email at a time for one email account only.

All scripts are accessible for viewing. They can also be imported into your own solution.
